

High Fidelity - Affordances, Gestalt and Constraints

Affordances:

- Button like “Donate”, “Volunteer” clearly indicates what they do.
- Users can easily find what **actions** they can take on the website. For example, on the header they can see buttons with clear text. From there, they can also go to the options available in the dropdown menu. This doesn’t overwhelm the user with all the options at once.
- The color palette is engaging and visually appealing.

Gestalt principles:

- Similarity: To create a cohesive look, we made sure that fonts, colors, and overall format stayed the same and constant throughout the final prototype. In our case, this meant that all pages needed to include a flower header, and that gradients were applied whenever possible. We also kept images the same size when there were multiples on one page, like on the testimonials or the board of directors' page.
- Symmetry: We had to crop the logo into a circle since we noticed that the circle was off centered which made the website unappealing for us, and we thought about what the customers might think so we fixed this problem right away. For instance: lining the services on the homepage with the same gap, leaving the same space on both sides of the page, etc.
- Closure: For the icons like the social media icons we have made we have thought of how to make it more appealing to our customers by experimenting of how we can engage the icons to make it more presentable like making the icons not exactly square but bending it with enough radius.

Constraints:

- We also always plan our meetings ahead of time but sometimes we could not meet in person on time since we have a busy life as well, which limits our ability to meet up in sync. To improve, we have a specific app (Discord) that we can communicate freely to express concerns we may have with each other which helps our team environment to grow as a group.
- We also have had trouble with the limited use of plugins that could make “Figma” an application we have been using for the high-fidelity prototype, we were struggling with the website as well like especially for example when we were presenting the prototype to our customer there were some technical difficulties that was out of our control since “Figma” is an application that is known for this non user friendly interface. To be more specific when presenting the prototype to the clients, the website was finicky, and the menu at the top would not always go on the tab selected or disappear too soon, making it harder to navigate.
