

Customer Check In #2: Insights

Summary

The website looks good and feels clean and simple but could use more personalization. The home page also needs modifying, so it is not immediately wordy. The recommended solution is to sum up Reach Autism in 1-2 sentences maximum and have a read more button that takes users to a separate page with more information.

The top three priorities are:

- More pictures – reduce text clutter and make the site more personalized
- Where there is text, it has clear, concise wording. We don't want to turn people off by having them read too much – but information and the organization's values need to come across.
- Further to the above point, the organization's vision must be made clear. Within 2 minutes, a user should have a clear understanding of the core values. The founders gave this a neutral rating – while not bad, there is a clear improvement to be made.

Areas to Improve:

- They have expressed less wording on the homepage specifically in the “Who We Are” section. The solution is to create a “Who We Are” page that can be linked here that contains the entire section.
- Reduce the clutter on the homepage.
- They want more color in some places. Also, the yellow gradient felt out of place.
- They dislike the small fonts, especially in the drop-down menus. These small fonts make the site less accessible. Can increase the size of the header “buckets” and drop-down text and decrease the amount of text on general pages.

A comment that kept resurfacing was making the website more “user-friendly.” They commented on how it looks more like a business rather than a friendly charity (70% business vs. 30% friendly). Another comment was that it looked too corporate and that it felt like “it was trying to sell me something.”

The donation page, for example, felt too businesslike and did not fit with the theme of the organization. The thank you message needs to be large and prominent, so the user feels that their donation is important. Focus on making the UI softer.

The site navigation was successful. Users were asked to navigate to certain pages, and the response time was recorded. Users were first asked to find two ways to navigate to the donation page from the home page. The average response time was 14 seconds. The second test was to look for the “Testimonials” page, a slightly harder test because it is in a drop-down menu. The average response time was 5 seconds.

However, some comments said that navigation should be prioritized more. This could be attributed to the limitations of the prototyping software Figma and the size of the drop-down menu text, but more variations of the navigation will be explored. One test user thought that the “Blog” page should be under the “About” section rather than “Resources.”

Liked:

- The picture on homepage really caught their attention
- The clients mentioned that the website feels professional and simple/clean
- They liked consistency between pages
- The yellow donate button was well received
- Health Suggestions page

Elements that need to be changed/added:

- “Sticky” header that stays on top while scrolling might be cool
- The flower title header
